West Nile Virus Activity Continues in August

Los Angeles, CA— The Greater Los Angeles County Vector Control District (GLACVCD) has confirmed two more West Nile virus positive (WNV+) dead birds and four WNV+ mosquito pools. The dead birds were collected from Whittier (zip code 90603) and Reseda (zip code 91335). The mosquito samples were collected in Panorama City (zip code 91402), Canyon Country (zip code 91387) and Whittier (zip codes 90605 and 90606). This is the first incidence of West Nile virus activity for Reseda, Panorama City and Canyon Country this year. Statewide, 219 dead birds and 562 mosquito samples have been confirmed positive for West Nile Virus so far this year.

Warm temperatures and standing water are perfect breeding conditions for mosquitoes. Under ideal conditions, a mosquito can emerge as an adult in as few as three days. A neglected rain barrel, abandoned pond or overlooked fountain can all breed thousands of mosquitoes. Disrupt mosquito breeding by eliminating standing water around your home. Clean bird baths, water dishes and troughs on your property weekly. Keep your pools and ponds filtered, or request free mosquito-eating fish from GLACVCD. Unclog rain gutters and replace trash can lids immediately after use. Rain barrels are also potential breeding sites if not properly maintained.

GLACVCD also encourages residents to report green pools and potential mosquito breeding problems in their neighborhoods. Service requests can be submitted online or over the phone, and can be made anonymously. A California-certified Vector Control Specialist will respond to the request within one business day.

West Nile virus is spread to people and animals through the bite of an infected mosquito. In addition to eliminating stagnant water, residents can take the following precautions to prevent mosquito bites and West Nile virus transmission:

-More-

News Release / P. 2

- Wear long sleeve shirts and pants when outdoors between dusk and dawn because that is when mosquitoes are most active.
- Use Center for Disease Control approved insect repellent containing DEET, Picaridin or oil of lemon eucalyptus.
- Keep properly maintained and well-fitted screens on your windows and doors to prevent mosquitoes from entering your home.

There is no cure for West Nile virus. One in five persons infected with West Nile Virus will exhibit symptoms. Symptoms usually occur between 5 and 15 days and can include fever, headache, body aches, nausea, or a skin rash. These symptoms can last for several weeks to months. One in 150 people infected with the virus will require hospitalization. Severe symptoms include high fever, muscle weakness, neck stiffness, coma, paralysis, and possibly death.

GLACVCD recommends that individuals exhibiting these symptoms following a mosquito bite consult a physician as soon as possible. Those at highest risk for severe cases of West Nile Virus are the elderly and people with weakened immune systems.

The public is encouraged to report dead birds to help with West Nile Virus surveillance and control efforts because birds play an important role in maintaining and spreading the virus. To reach the California Department of Public Health (CDPH), call their toll-free hotline at 877-WNV BIRD or visit them on-line at www.westnile.ca.gov. The District would like to thank the Los Angeles County Public Health Veterinarians for their continued diligence in collecting reported dead birds.
